

# Lab Exercise 1- Create POD in Kubernetes

## Objective:

- Understand the basic structure and syntax of a Kubernetes Pod definition file (YAML).
- Learn to create, inspect, and delete a Pod in a Kubernetes cluster.

## Prerequisites

- Kubernetes Cluster: You need a running Kubernetes cluster. You can set up a local cluster using tools like Minikube or kind, or use a cloud-based Kubernetes service.
- kubectl: Install and configure kubectl to interact with your Kubernetes cluster.
- Basic Knowledge of YAML: Familiarity with YAML format will be helpful as Kubernetes resource definitions are written in YAML.

## Step-by-Step Guide

### Step 1: Create a YAML File for the Pod

We'll create a Pod configuration file named **pod-example.yaml**

```
apiVersion: v1
kind: Pod
metadata:
  name: my-pod
  labels:
    app: my-app
spec:
  containers:
    - name: my-container
      image: nginx:latest
```

## Explanation of the YAML File

- **apiVersion:** Specifies the version of the Kubernetes API to use. For Pods, it's typically v1.
- **kind:** The type of object being created. Here it's a Pod.
- **metadata:** Provides metadata about the object, including name and labels. The name must be unique within the namespace, and labels help in identifying and organizing Pods.
- **spec:** Contains the specifications of the Pod, including:
  - **containers:** Lists all containers that will run inside the Pod. Each container needs:
    - **name:** A unique name within the Pod.
    - **image:** The Docker image to use for the container.
    - **ports:** The ports that this container exposes.
    - **env:** Environment variables passed to the container.

## Step 2: Apply the YAML File to Create the Pod

Use the `kubectl apply` command to create the Pod based on the YAML configuration file.

```
kubectl apply -f pod-example.yaml
```

This command tells Kubernetes to create a Pod as specified in the `pod-example.yaml` file.

## Step 3: Verify the Pod Creation

To check the status of the Pod and ensure it's running, use:

```
kubectl get pods
```

This command lists all the Pods in the current namespace, showing their status, restart count, and other details.

You can get detailed information about the Pod using:

```
kubectl describe pod my-pod
```

This command provides detailed information about the Pod, including its events, container specifications, and resource usage.

#### **Step 4: Interact with the Pod**

You can interact with the running Pod in various ways, such as accessing the logs or executing commands inside the container.

##### **View Logs: To view the logs of the container in the Pod:**

```
kubectl logs my-pod
```

##### **Execute a Command: To run a command inside the container:**

```
kubectl exec -it my-pod -- /bin/bash
```

The `-it` flag opens an interactive terminal session inside the container, allowing you to run commands.

#### **Step 5: Delete the Pod**

To clean up and remove the Pod when you're done, use the following command:

```
kubectl delete pod my-pod
```

This command deletes the specified Pod from the cluster.
